METHOD FOR CREATING OR CHANGING SUBSCRIBER-RELATED ENTRIES IN A DATABASE

Abstract

5 Method for creating or changing subscriber-related entries in a first database of a service which is implemented using HTTP. According to the method, a previously implemented trigger is activated on the basis of an HTTP proxy platform when the service is called. User-entered service-related and subscriber-related data is called from a second database and is created or modified in the first database and after installation is complete.

10 The trigger in the platform is deactivated on a subscriber-related basis.
